

Redshift Serverless : Console Overview

Summary

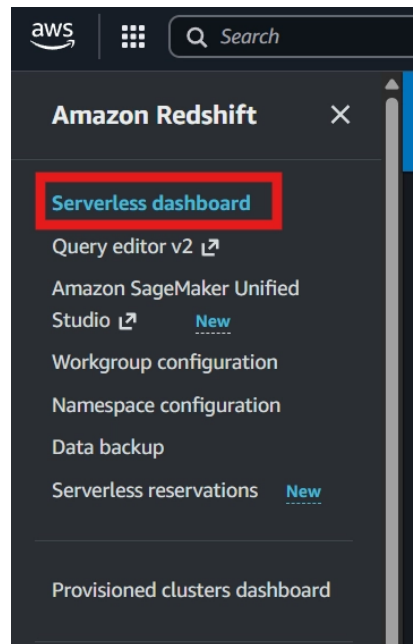

In these notes, we are going to see the overview for the Amazon Redshift Serverless Dashboard.

Accessing AWS Redshift

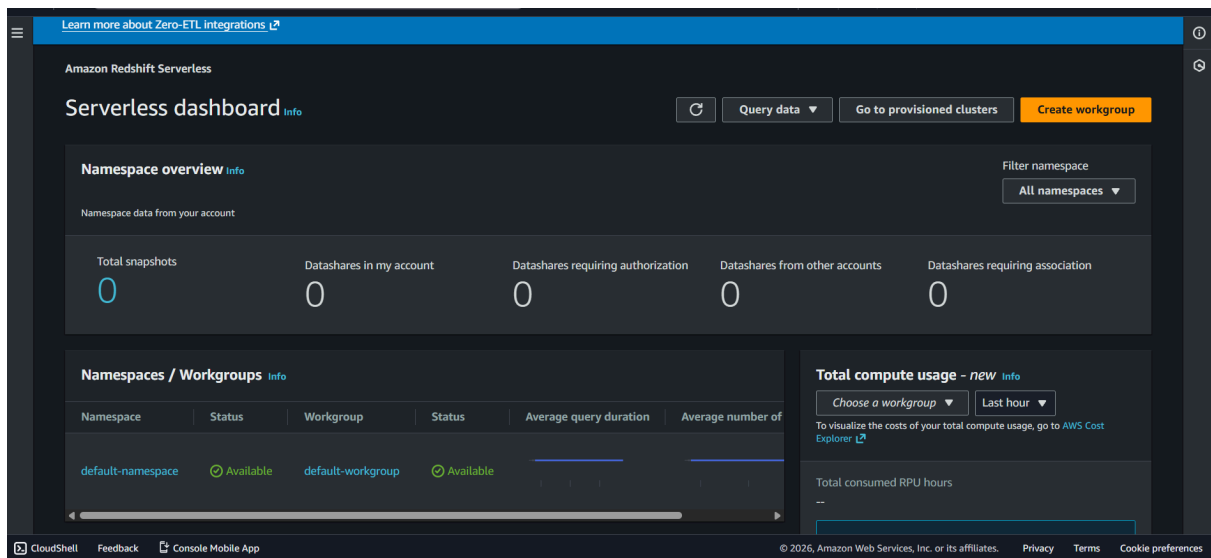

- Go to homepage and search for Redshift.

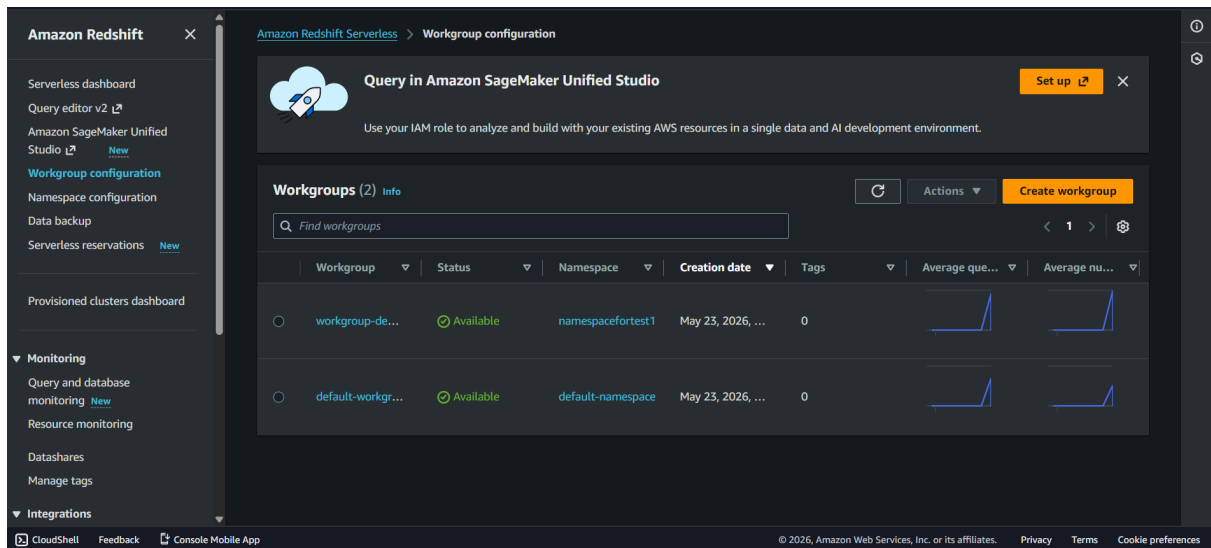

- Click on Redshift.

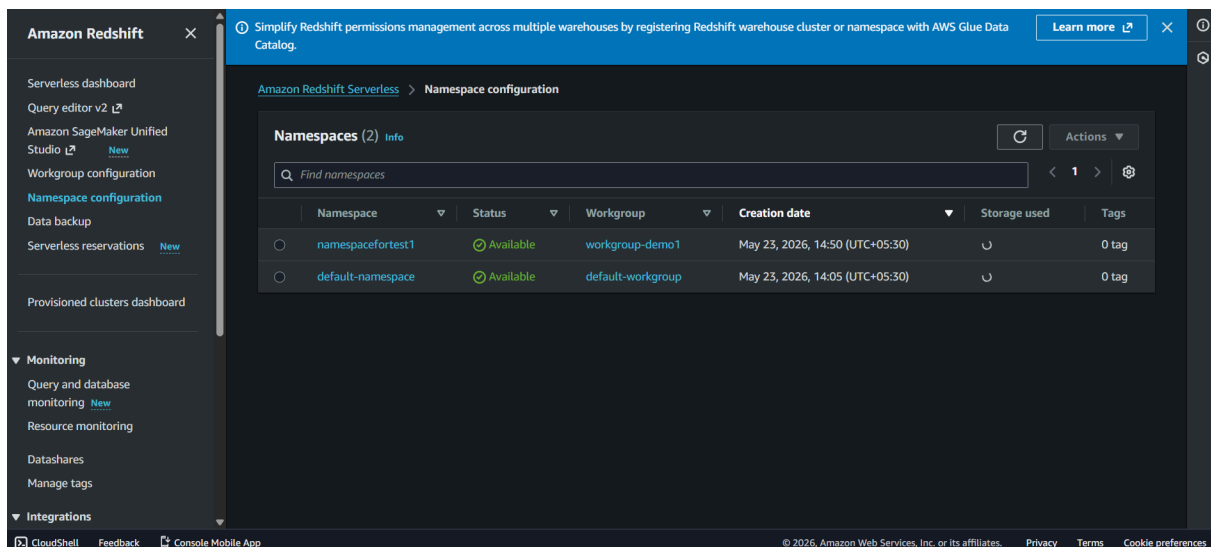

- Click Serverless Dashboard in the sidepanel and open the Dashboard.

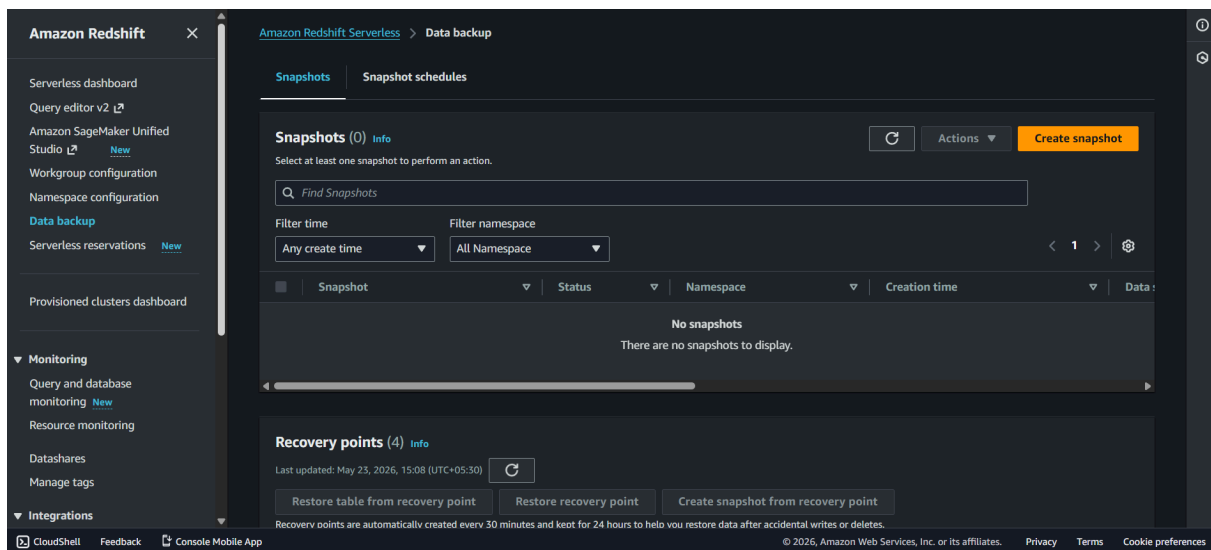

- Click on the query editor to access the query editor you have accessed earlier.

- Workgroup configuration provides the list of available workgroups and their details.

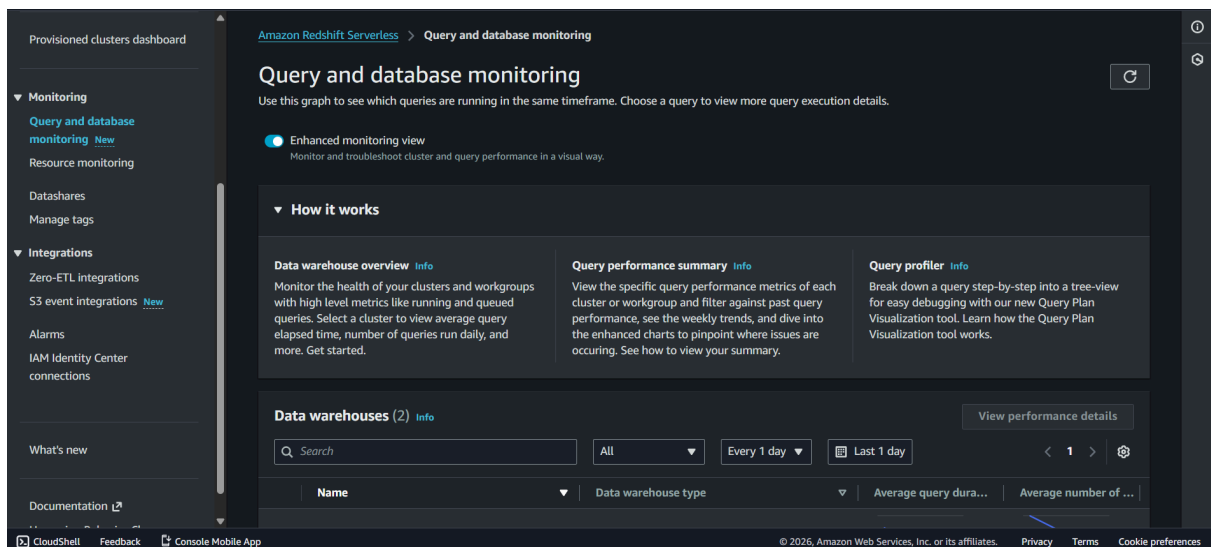

- Namegroup configuration provides the list of available namegroups and their details.

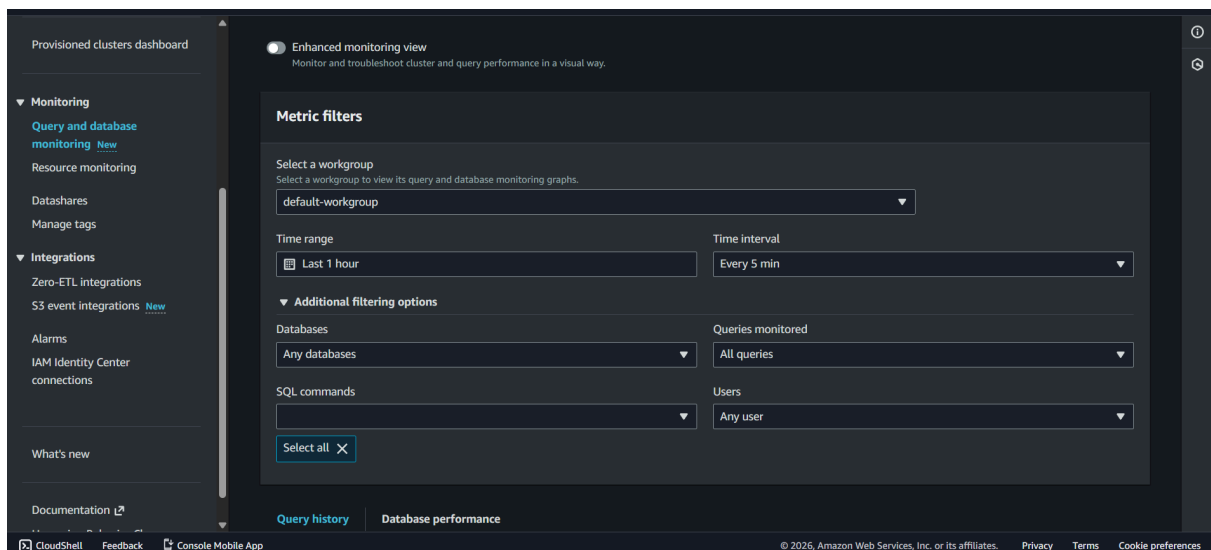

- Any snapshot or recovery point can be accessed via Data backup.

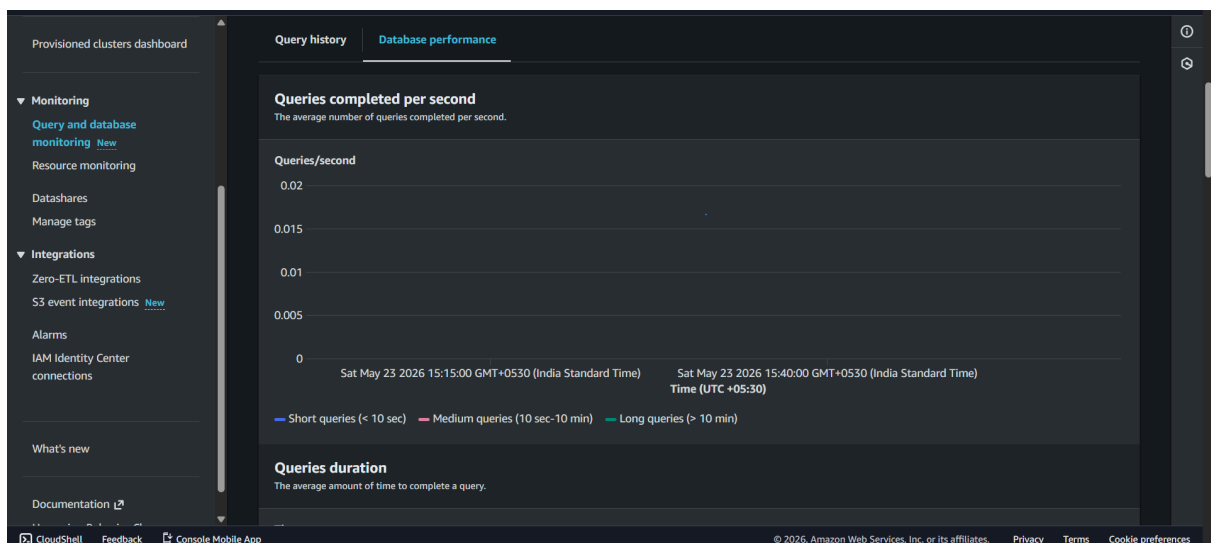

Monitoring Panel

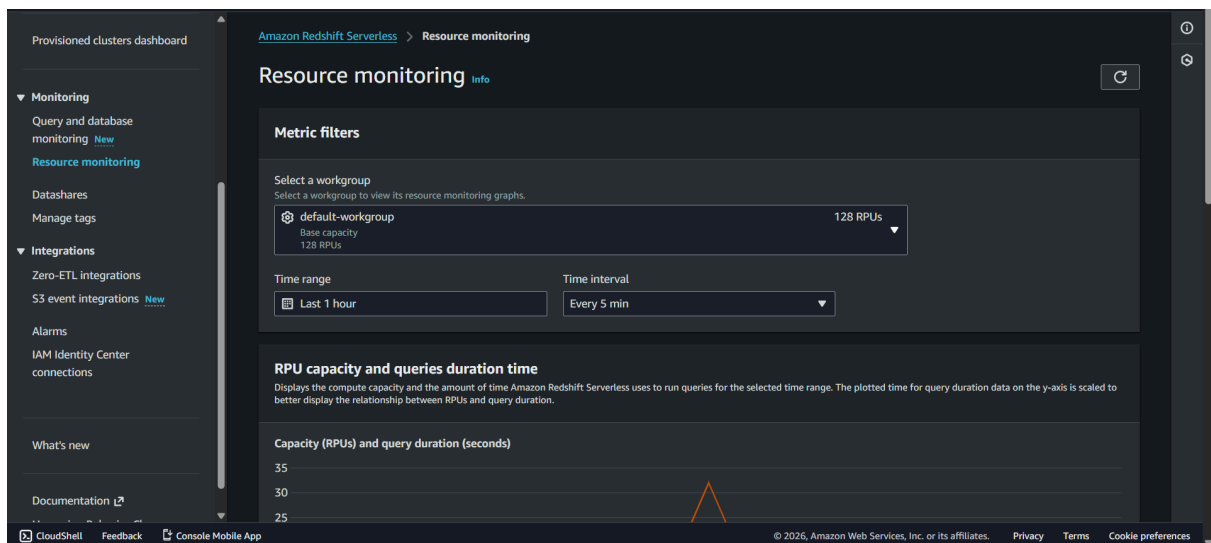

- If you enable Enhanced Monitoring view, you will not be able to see the default metrics because it works differently, disable it for now.

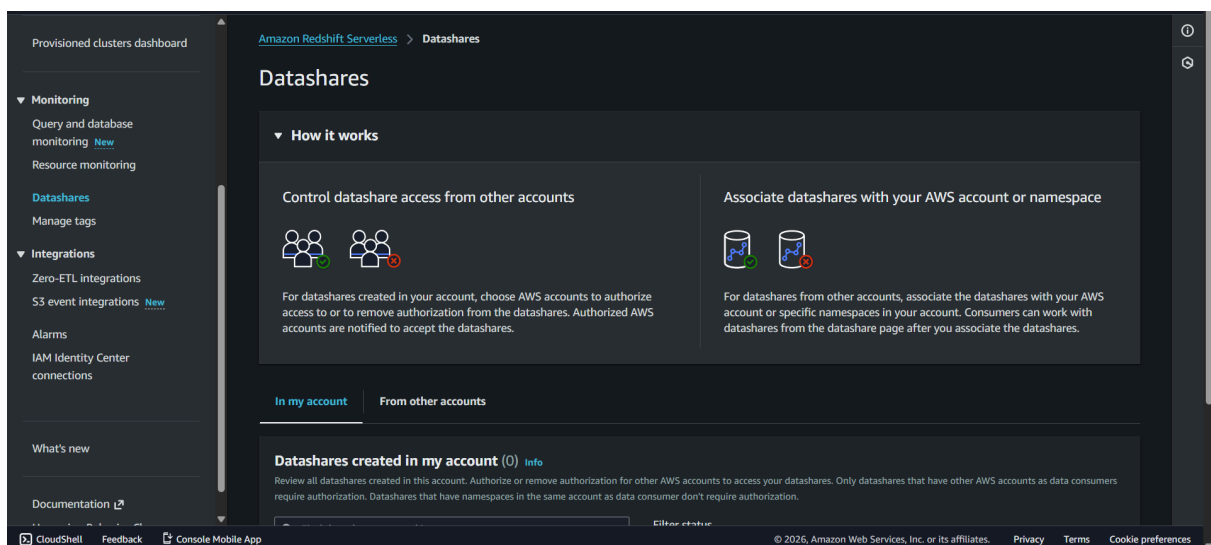

- The query and database monitoring provides you the metrics for queries and various filters that are used to provide a proper insight on queries running, done, etc. or advanced filters like top 100 queries by duration, etc.

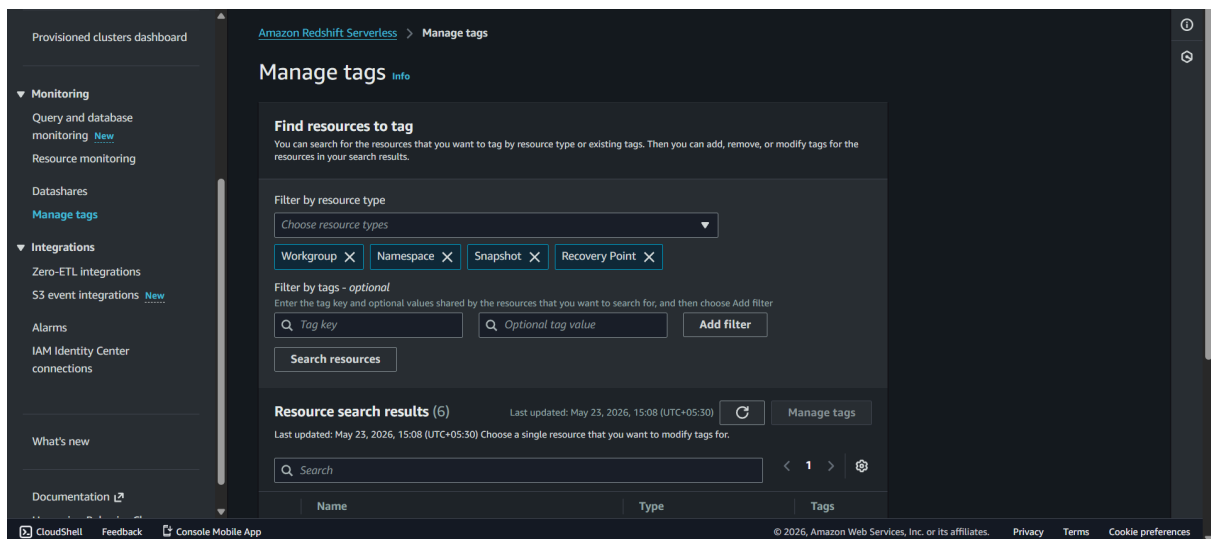

- There is a specific Database performance panel to see the database performance, queries duration, database connections, running queries, etc.

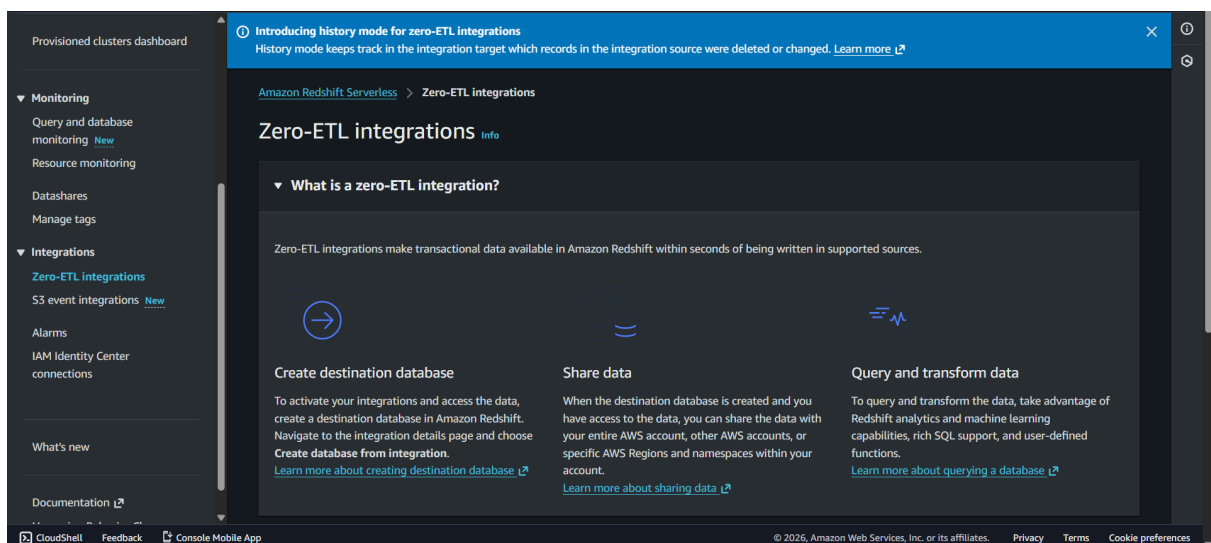

- Resource Monitoring helps us to see the RPU capacity, queries duration time, compute usage and the filter it based on Time Range and Time Intervals.

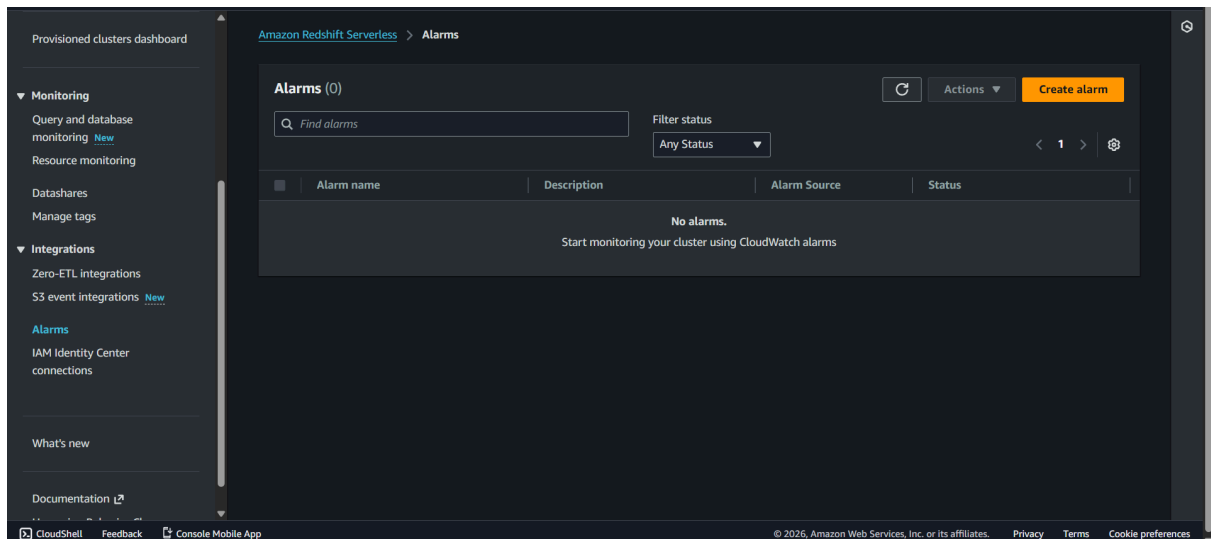

- Any Datashare can be accessed through this page.

- Any tags on your namegroup, snapshot can be accessed from Manage Tags page.

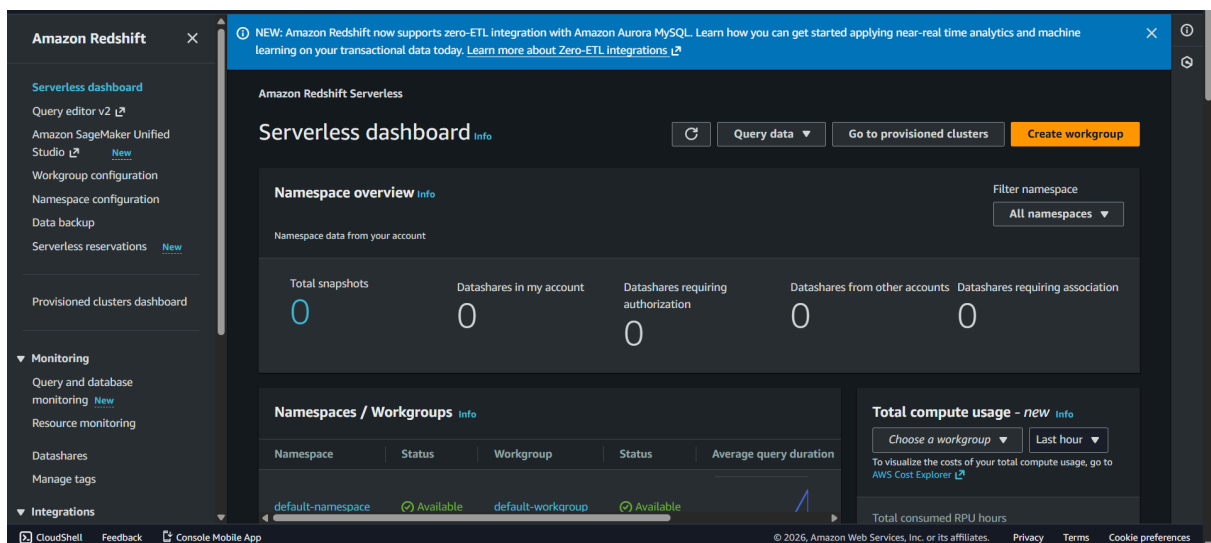

- Any Zero-ETL integration can be accessed from here.

- Alarms if you have created any can be access from alarms page.

Dashboard

- This provides us the quick view of various options such as the total snapshots, data shares, the namespaces and workgroup metrics and other more metrics as well.
